RINGSPANN®

RINGSPANN GmbH has been in business for over 75 years and is a world leader in Power Transmission and Workholding Technology. RINGSPANN CORPORATION, as a wholly owned subsidiary of RINGSPANN GmbH, designs, manufactures and assembles sprag and roller clutches mainly for the North American market. With innovative German engineering and American ingenuity, RINGSPANN CORPORATION offers the winning combination of quality products for your needs.

Products contained in this catalog represent RINGSPANN CORPORATION's standard freewheel clutches. Located in a 20,000 sq. ft. manufacturing facility, RINGSPANN CORPORATION can readily design new or modify existing products to suit your application.

The RINGSPANN CORPORATION service advantage:

- Detailed application support backed by over 75 years of experience.

- Direct sales and service from the manufacturer

- 24 hour emergency service

- North American industry leader for
  - Price
  - Delivery
  - Customer service
  - Quality

The RINGSPANN CORPORATION design advantage:

- American design and manufacture

- Patented sprag cage designs for increased torque and maximum life

- Maximum torque in a minimum space

- Sprag Lift off "X" and "Z" for infinite, maintenance free life

- Individual springs on every sprag to provide added security against failures

Freewheels are machine elements with particular characteristics:

- In one direction of rotation there is no contact between the inner and outer ring; the freewheel is in freewheeling operation.

- In the opposite direction of rotation there is contact between the inner and outer ring; in this direction it is possible to transmit torque.

For example the outer ring of the freewheel shown in figure 4-1 can freewheel clockwise while the inner ring is stationary. If, however, the outer ring is turned in the opposite direction, there is contact between the inner and outer ring and the inner ring is driven (driving operation).

Freewheels are used as:

- ▶ Backstops
- ▶ Overrunning Clutches
- ▶ Indexing Freewheels

Freewheels can fulfill these functions completely automatically in the most diverse machines. No mechanical or hydraulic operating equipment is required, such as externally actuated clutches or brakes.

Freewheels consist of an inner and an outer ring between which clamping elements are arranged. Clamping elements can be sprags or rollers. We differentiate as follows:

- Freewheels with bearing support and
- Freewheels without bearing support.

For a freewheel to function, concentric alignment of the inner and outer ring is required. In the case of freewheels without bearing support, concentric alignment must be provided by the customer.

RINGSPANN freewheels are an indispensable design element in the machine building industry. Many designs are only economical if freewheels are used. The freewheel as an automatic driving element is preferred to conventional solutions because it offers the following significant advantages:

- safe
- efficient
- high degree of automation

Locking direction or driving operation   *Freewheeling direction or freewheeling operation*

Inner ring   Clamping elements (Sprags or Rollers)   Outer ring

4-1
With more than 50 years experience in the development, production and sales of freewheels, RINGSPANN offers the most comprehensive range of freewheels. A global network of subsidiaries and sales agencies ensures the best possible personal on-site service. Assembly and production facilities in various countries provide fast, reliable delivery.

4-2
▶ Backstop

Freewheels are used as backstops if reverse rotation of the operating equipment needs to be prevented. In many machines and installations, for technical safety or functional reasons, it is necessary to ensure that the operating equipment is in just one specific direction of rotation. Backstops are used where legal stipulations require a mechanical safety device be installed for the operation of conveyor systems.

The normal operating mode of a backstop is freewheeling operation; the locking (torque transmission) is performed at zero speed. The immediate engagement of the clamping elements ensures the required high operating safety.

Freewheeling operation

5-1
In general, backstops are used where the inner ring freewheels and the stationary held outer ring prevents reverse rotation (figure 5-1).

Freewheeling operation

5-2
The more complicated designed backstops where the outer ring freewheels and the stationary held inner ring prevents reverse rotation are rarely used today (figure 5-2).

▶ Overrunning Clutch

The overrunning clutch engages machines or machine parts and automatically interrupts their contact as soon as the driven part of the overrunning clutch is turned faster than the driving part. In many cases, this can replace a more expensive externally actuated clutch.

With overrunning clutches the engagement takes place in the driving operation (torque transmission), while in freewheeling operation the torque transmission between the inner and outer ring is interrupted. In driving operation the speeds of the inner and outer ring are equal, while in freewheeling operation they are different.

Freewheeling operation   Driving operation   5-3
Figure 5-3 shows an overrunning clutch where in driving operation the power flow is transferred from the inner ring to the outer ring and in freewheeling operation the outer ring overruns the inner ring at a higher speed.

Freewheeling operation   Driving operation   5-4
Figure 5-4 shows an overrunning clutch where in driving operation the power flow is transferred from the outer ring to the inner ring and in freewheeling operation the inner ring overruns the outer ring at a higher speed.

▶ Indexing Freewheel

The indexing freewheel transmits a back and forth motion into a stepped rotation (indexed feed). The RINGSPANN indexing freewheel enables an infinitely adjustable setting of the feed, for precise and quiet operation.

Driving operation   Freewheeling operation   5-5
Figure 5-5 shows an indexing freewheel where the outer ring makes the back and forth motion and the inner ring carries out the indexed feed.

Figure 5-6 shows an indexing freewheel where the inner ring makes the back and forth motion and the outer ring carries out the indexed feed.

Applications for Freewheels

▶ Areas of application for Backstops

Gear units
Electric motors
Gear motors

Inclined conveyors
Elevators
Bucket elevators
The backstop prevents reverse rotation of the drive of a conveyor installation if the power fails or the motor is turned off.
The backstop prevents reverse rotation of the conveyor load if the power fails or the motor is turned off.

▶ Areas of application for Overrunning Clutches

Textile machines
Printing machines
Fans

During normal operation of textile or printing machines, the overrunning clutch separates the auxiliary drive which is used as a starter from the main drive.
If fans are turned off, the overrunning clutch prevents the flywheel mass from rotating the drive.

▶ Areas of application for Indexing Freewheels

Textile machines
Printing machines

Packaging machines
Filling plants
The indexing freewheel generates an indexed feed in textile and printing machines.
The indexing freewheel is used in packaging machines and filling plants for an indexed feed.

Fans
The backstop prevents the motor from reverse rotation under the back pressure when it is turned off.

Pumps
Compressors
The backstop prevents the motor from reverse rotation under the back pressure when it is turned off.

Pumps
Generators
In multimotor drives the overrunning clutch disengages the inactive or lower speed drive.

Roller conveyor
The overrunning clutch ensures that the conveyed material can be pushed or pulled faster over the rollers than the speed of the drive.

High voltage switches
In high voltage switches for tensioning a spring, the indexing freewheel is used in the place of a reduction gear.

Seed spreader
The indexing freewheel replaces a reduction gear in seed spreader.

		Standard type	Type with sprag lift-off X	Type with sprag lift-off Z
		For universal use	To extend service life using sprag lift-off for high speed rotating inner ring	To extend service life using sprag lift-off for high speed rotating outer ring
Use as	**Backstop**	Up to medium speeds during freewheeling operation (inner or outer ring freewheels)	Up to very high speeds during freewheeling operation (inner ring freewheels)	Up to very high speeds during freewheeling operation (outer ring freewheels)
	Overrunning Clutch	Up to medium speeds during freewheeling operation (inner or outer ring overruns)	Up to very high speeds during freewheeling operation (inner ring overruns)	Up to very high speeds during freewheeling operation (outer ring overruns)
		Up to very high speeds in driving operation (outer or inner ring drives)	Low speeds in driving operation (outer ring drives)	Low speeds in driving operation (inner ring drives)
	Indexing Freewheel	Up to a medium total number of actuations		

In addition to the standard type, RINGSPANN has developed other types to extend service life for freewheels with sprags. The table above lists the recommended application conditions for these types.

Type with sprag lift-off X

The sprag lift-off X is used for backstops and overrunning clutches, provided that in freewheeling operation the inner ring is rotating at high speed and with overrunning clutches that the driving operation is at a low speed. In freewheeling operation, the centrifugal force F_C causes the sprag to lift off from the sprag track of the outer ring. In this operating state, the freewheel operates wear-free with unlimited service life.

Figure 8-1 shows a freewheel with sprag lift-off X in freewheeling operation. The sprags, which are supported in a cage connected to the inner ring, rotate with the inner ring. The centrifugal force F_C that is applied in the center of gravity S of the sprag turns the sprag counterclockwise and rests against the support ring of the cage. This results in the gap "a" between the sprag

8-2
and the sprag track of the outer ring; the freewheel works without contact. If the inner ring speed decreases to such an extent that the effect of the centrifugal force on the sprag is less than that of the spring force F_F, the sprag again

rests on the outer track and the freewheel is ready to lock (figure 8-2). If used as an overrunning clutch, the driving speed must not exceed 40% of the lift-off speed.

Type with sprag lift-off Z

The sprag lift-off Z is used for backstops and overrunning clutches, provided that in freewheeling operation the outer ring is rotating at high speed, and with overrunning clutches that the driving operation is at a low speed. In freewheeling operation, the centrifugal force F_C causes the sprag to lift off from the sprag track of the inner ring. In this operating state, the freewheel operates wear-free with unlimited service life.

Figure 8-3 shows a freewheel with sprag lift-off Z in freewheeling operation. The sprags rotate with the outer ring. The centrifugal force F_C that is applied in the centre of gravity S of the sprag turns the sprag counterclockwise and rests against the outer ring. This results in the gap "a" between the sprag and the sprag track of the

8-4
inner ring; the freewheel works without contact. If the outer ring speed decreases to such an extent that the effect of the centrifugal force on the sprag is less than that of the spring force F_F

, the sprag again rests on the inner track and the freewheel is ready to lock (figure 8-4). If used as an overrunning clutch, the driving speed must not exceed 40% of the lift-off speed.

Selection torque for Backstops

Bringing a loaded inclined conveyor, an elevator or a pump to a standstill is a highly dynamic process that incurs high peak torques. These peak torques are critical in the selection of the backstop. The determination of peak torques in the case of locking is more accurate by using a rotational vibration analysis of the entire system. This requires a knowledge of rotational masses, the rotational rigidity and the excitation moments that occur in the system. In many cases, a vibrational calculation is too time consuming or you may not have all the necessary data in the configuration phase available. In this case, the selection torque M_A of the backstop should be determined as follows:

$$M_A = 1.75 \cdot M_L \ [lb\text{-}ft]$$

Often you only have the figures for the motor nominal output P_0 [hp] available. Then:

$$M_A = F \cdot 5250 \cdot P_0/n_{SP} \ [lb\text{-}ft]$$

In these equations:

M_A = Selection torque of the backstop [lb-ft]

M_L = Static backdriving torque of the load referring to the backstop shaft [lb-ft]

P_0 = Nominal power of motor [hp]

n_{SP} = Speed of backstop shaft [rpm]

F = Selection factor (refer to table)

After calculating M_A the backstop size must be selected in accordance with the catalog tables in such a way that in all cases this applies:

$$M_N \geq M_A$$

M_N = Nominal torque of the backstop in accordance with the table values [lb-ft]

It must be noted that, with a direct motor start in the locking direction of a backstop, very high peak torques can occur which in turn can destroy the backstop.

Approximate values for F:

Type of installation	F
Conveyor belts, angle up to 6°	0.88
Conveyor belts, angle up to 8°	1.07
Conveyor belts, angle up to 10°	1.21
Conveyor belts, angle up to 12°	1.29
Conveyor belts, angle up to 15°	1.39
Screw pumps	1.51
Ball mills, drying drums	1.26
Bucket conveyors, elevators	1.48
Hammer mills	1.51
Fans, Ventilators	0.49

Selection torque for Overrunning Clutches

In many cases where overrunning clutches are being used, dynamic processes occur that cause high peak torques. In the case of overrunning clutches, the torques that occur during start up must be observed. The peak torques when starting up can, in the case of asynchronous motors – especially when accelerating large masses and when using elastic couplings – significantly exceed the torque calculated from the motor pull-over torque. The conditions for internal combustion engines are similar. Even in normal operation, their degree of irregularity, peak torques can occur that are considerably greater than the nominal torque.

The prior determination of the maximum occurring torque is carried out more accurately by using a rotational vibration analysis of the entire system. This, however, requires a knowledge of the rotating masses, the rotational rigidity and all of the excitation moments that occur on the system. In many cases, a vibrational calculation is too time consuming or you may not have all the necessary data in the configuration phase available. In this case, the selection torque M_A of the overrunning clutch should be determined as follows:

$$M_A = K \cdot M_L$$

In this equation:

M_A = Selection torque of the freewheel

K = Operating factor (refer to table)

M_L = Load torque for constant rotating freewheel:

$$= 5250 \cdot P_0/n_{FR}$$

P_0 = Nominal power of motor [hp]

n_{FR} = Speed of the freewheel in driving operation [rpm]

After calculating M_A the freewheel size must be selected in accordance with the catalog tables in such a way that in all cases this applies:

$$M_N \geq M_A$$

M_N = Nominal torque of the freewheel in accordance with the table values [lb-ft],

Approximate values for operating factor „K":

Type of driver	K
Electric motors with low start up impact (e.g. DC motors, asynchronous motors with slip rings or soft start couplings), steam turbines, gas turbines	0.8 to 2.5
Electric motors with considerable start up impact (e.g. synchronous or asynchronous motors with direct start)	1.25 to 2.5
Piston engines with more than two cylinders, water turbines, hydraulic motors	1.25 to 3.15
Piston engines with one or two cylinders	1.6 to 3.15

The operating factor K depends on the properties of the driver and the machine. The general rules of mechanical engineering apply here. We know from practice that applications are known where the operating factor K can also assume values of up to 20, e.g. with a direct start-up of asynchronous electric motors in connection with elastic couplings.

Selection torque for Indexing Freewheels

The selection torque for indexing freewheels is, among other things, dependent upon how the back and forth motion is generated (crank operation, hydraulic cylinders, pneumatic cylinders etc.). It cannot be specified in a simple equation. When stating the maximum torque to be transmitted, we are happy to advise you regarding the selection torque.

Complete Freewheels FRS and FRSG

for bolting to the face
with sprags

10-1

RINGSPANN has developed a utility model for such applications with reversible operation. 10-1

Application as

▶ Backstop
▶ Overrunning Clutch
▶ Indexing Freewheel

Features

Complete Freewheels FRS and FRSG are sealed sprag freewheels with ball bearings and ready for installation.

The freewheels FRS are supplied oil-filled.

The freewheels FRSG are supplied grease filled.

Maximum torques up to 55 000 lb-ft.

Bores up to 7 inch. Standard bores in inch dimension are available from stock. Metric bores on request.

Application example

Complete Freewheels FRS 600 in both drive units of a transport system with a conveyor belt that moves both forward and backward (reversible operation). In order to ensure that the conveyor belt is moved under tension, forward movement is driven by drive unit I, reverse movement by drive unit II. The freewheels automatically disengage the respective non working drive, eliminating the need for expensive external clutches or brakes.

For forward movement, drive unit II is started in freewheeling direction of freewheel II; freewheel II is in freewheeling operation and disengages drive unit II from the conveyor belt. Afterwords drive unit I is started in the locking direction of the freewheel I; freewheel I is in driving operation and the conveyor belt is moved forward by drive unit I. The speed of drive unit I is lower than that of drive unit II. Thus freewheel II remains in freewheeling operation and drive unit II is not improperly engaged.

For reverse movement, the drive units are started in reverse order and direction of rotation at the corresponding speeds.

The mentioned application for a reversing conveyor requires speed control for both of the drives.

Conveyors operating in the same direction can use clutches in conjunction with the two drives.

* Z = Number of tapped holes G on pitch circle T.
** Six holes are equally spaced 60° apart with two additional holes located 30° from the six equally spaced holes and 180° apart.
Keyway dimensions upon request by customers.

Mounting

The customer attachment part is centered on the external diameter D and then bolted on to the face.

The recommended tolerance of the shaft is + 0 / - 0.001 inch and the tolerance of the pilot diameter D of the attachment part is - 0 / + 0.002 inch.

Labyrinth Seals

Labyrinth seals are available to provide additional protection for harsh environments.

Complete Freewheels FRX and FRZ

**for bolting to the face
with sprag lift-off X or lift-off Z**

12-1

Application as

▶ Backstop
▶ Overrunning Clutch

Features

Complete Freewheels FRX and FRZ are sealed sprag freewheels with ball bearings and sprag lift-off X or sprag lift-off Z.

Maximum torques up to 30 000 lb-ft.

Bores up to 5.438 inch. Standard bores in inch dimension are available from stock. Metric bores on request.

Main motor drive   Freewheel FRX 600   Creep drive

12-1
Application example

Complete Freewheel FRX 600 as an overrunning clutch in the drive unit of a conveyor belt system with additional creep drive. The freewheel with shaft coupling is installed between the main motor and the creep drive. When the creep drive operates, the freewheel is in driving operation and drives the belt at low speed. During normal operation (freewheeling operation), the main motor drives and the inner ring overruns and the creep drive is automatically disengaged. With this high speed, sprag lift-off X is used; the sprags work in freewheeling operation without contact and are wear-free.

* Not available for FRX. Max bore 0.875 inch.
** Z = Number of tapped holes G on pitch circle T.
*** Six holes are equally spaced 60° apart with two additional holes located 30° from the six equally spaced holes and 180° apart.
Keyway dimensions upon request by customers.

Mounting

The customer attachment part is centered on the external diameter D and then bolted on to the face.

The recommended tolerance of the shaft is + 0 / - 0.001 inch and the tolerance of the pilot diameter D of the attachment part is - 0 / + 0.002 inch.

Labyrinth Seals

Labyrinth seals are available to provide additional protection for harsh environments.

Complete Freewheels FRXF

with torque arm
with sprag lift-off X and sealed grease lubricated ball bearings

14-1

Application as

▶ Backstop

Features

Complete Freewheels FRXF are freewheels with sprag lift-off X, labyrinth seals, and sealed grease lubricated ball bearings. All units are supplied complete with torque arms. FRXF backstops are maintenance free and lubricated for life prior to shipping.

Maximum torques up to 29 000 lb-ft.

Bores up to 4.5 inch. Standard bores are available from stock.

Application example

Complete Freewheel FRXF as backstop, arranged at the end of a high speed shaft of the gearbox. The back driving torque is restrained by the clutch torque arm and the gearbox torque arm pin.

With this high shaft speed under normal operation (freewheeling operation), sprag lift-off X is used; the sprags work in freewheeling operation without contact and are wear-free.

See page 9 for determination of selection torque.
* Maximum recommended operating speed.
Keyway dimensions upon request by customers.

Mounting

The back driving torque is restrained by the clutch torque arm and the gearbox torque arm pin. It must have clearance of 1/4 inch to 1/2 inch in both radial and axial directions.

Complete Freewheels FRXF are furnished to size for a slip fit on the shaft.

Non lift off clutch varieties are available when operating below sprag lift off speeds.

Lubrication

The freewheels FRXF 700 and larger are supplied with labyrinth seals, sealed grease lubrication ball bearings and required no additional lubrication.

Complete Freewheels RFB

with torque arm and clamping collar or mounting flange
with sprags and grease lubricated ball bearings

16-1

Application as

▶ Backstop

Features

Complete Freewheels RFB are sprag freewheels with sealed grease lubricated ball bearings that require no maintenance. They are supplied with a clamping collar or a flange for direct mounting to standard bushings.

Maximum torques up to 900 lb-ft.

Bores up to 6 inch with clamping collar.
16-2

Application example

Complete Freewheel RFB as a backstop on a radial fan. The backstop prevents reverse rotation of the fan shaft from air flow or from incorrectly polarized drive motor.

See page 9 for determination of selection torque.
* A 3/4 inch diameter arm extension is available upon request.

Mounting

Backstops RFB are mounted with either a clamping collar to shaft end or a mounting flange that can be connected directly to a QD or Taper Lock bushing.

Additional shaft accessories may be required for RFB-TL designs, contact RINGSPANN.

Complete Freewheels FR … CA

with gear coupling
with sprags

18-1
Application as

▶ Overrunning Clutch

Features

Complete Freewheel FR … CA incorporate a freewheel FR … and a gear coupling. Freewheels are supplied oil or grease lubricated.

Maximum torques up to 55 000 lb-ft.

Bores up to 7 inch.

Complete Freewheels FR … CA allow for removal of the assembly without moving the connected equipment. The clutch should always be mounted on the low temperature shaft of the application.

Application Example

Two Complete Freewheels FR … CA with gear coupling as overrunning clutches in the drive unit of a tube mill with additional auxiliary drive. A freewheel FRSG 600 CA 2.0 (Freewheel 1) is arranged between the main drive and the right angle gear box. A freewheel FRZ 500 CA 1.5 (Freewheel 2) with sprag lift-off Z (page 20) is positioned between the auxiliary drive and the right angle gear box. If the auxiliary drive is operating, Freewheel 2 works in the driving operation and the Freewheel 1 overruns at a low speed (freewheel operation). When driving via the main drive, the unit is driven thru Freewheel 1 (driving operation) Freewheel 2 overruns and automatically disengages the auxiliary drive (freewheeling operation). With the high speed, the type with sprag lift-off Z is used. There is no contact of the sprags during freewheeling and therefore no wear.

Torque arms TA for Complete Freewheels FR …   21-1
Torque Arms TA

Torque Arms TA are offered as an accessory for Freewheels FRS, FRSG and FRX when used as a backstop.

The torque arms are supplied pre-drilled and ready for installation.

Installation

The torque arm must not be rigidly anchored but must be restrained by either a non-threaded pin or an angle iron bracket.

When a pin is used the diameter of the pin must be 1/32 of an inch smaller than the pin hole diameter N of the torque arm.

Torque Arm	C	E	H	J	N	Q	Weight

Low Speed Backstops FRHD

with torque arm
with sprags
22-1

Application as

▶ Backstop

for installations with low speeds. The freewheels are designed for the use in inclined conveyor-belts, elevators or pumps. Taconite seals protect the freewheels from contamination with dust or dirt.

Features

Low Speed Backstops FRHD with torque arm are sealed sprag freewheels with ball bearings. They are supplied oil-filled and ready for installation.

The Low Speed Backstops are arranged on through shafts or shaft ends.

Maximum torques up to 2 400 000 lb-ft.

Bores up to 21 inch.

Application example

Backstop FRHD 900 on the head pulley shaft of an inclined conveyor belt system. The torque arm is bolted to the freewheel. The back driving torque is restrained by the torque arm on the base plate. When the conveyor belt is without any load, the drum shaft can be turned in both directions during maintenance by removing the torque arm pins.
Motor
Reduction gear
Head pulley
Conveyor Belt

Low Speed Backstops FRHM
with torque arm
with sprags

24-1

24-2

Application as

▶ Backstop

for installations with low speeds. The freewheels are designed for the use in inclined conveyor-belts, elevators or pumps. Taconite seals protect the freewheels from contamination with dust or dirt.

Features

Low Speed Backstops FRHM with torque arm are sealed sprag freewheels with ball bearings. They are designed for interchanging the Morse® CB units, supplied oil-filled and ready for installation.

The Low Speed Backstops FRHM are arranged on through shafts or shaft ends.

Maximum torques up to 56 000 lb-ft.

Bores up to 7 inch.

Application example

Backstop FRHM 900-12 on the head pulley shaft of an inclined conveyor. The back driving torque is restricted by the torque arm on the base plate.
Mounting

The back driving torque is restrained by the torque arm. The torque arm must not be clamped into position. It must have 0.5 inch play in the axial and in the radial direction.

FRHM backstops are supplied for a clearance fit. Set screws on the inner ring are provided for axial retention, shaft collars are not required.

Morse® is a registered trademark of Borg Warner.

Internal Freewheels FZ …

with ball bearing properties
26-1
26-2
26-3

Application as

▶ Backstop
▶ Overrunning Clutch
▶ Indexing Freewheel

Features

Internal Freewheels FZ … are sprag freewheels with bearing support and ball bearing properties. The freewheels are supplied grease-filled for normal operating conditions.

The freewheel is built into the customer housing. This makes compact, space-saving fitting solutions possible.

Maximum torques up to 619 lb-ft/840 Nm. The torque is transmitted on the inner ring and/or on the outer ring by press fit or keyway connection.

Bores up to 1.575 inch/40 mm.

The following series are available:

Series	Torque transmission on				2RS-seals	Page
	outer ring by		inner ring by			
	keyway	press fit	keyway	press fit		
FZ		◎		◎		27
FZ … 2RS		◎		◎	◎	28
FZ … P2RS		◎	◎		◎	28
FZ … P		◎	◎			29
FZ … PP	◎		◎			29

Internal Freewheels FZ 6201 to FZ 6207, FZ 6201 P to FZ 6207 P and FZ 6202 PP to FZ 6207 PP have the same dimensions as the respective ball bearings of series 62. The freewheel sizes FZ 6208, FZ 6208 P and FZ 6208 PP as well as the series FZ … 2RS and FZ … P2RS have a different width B.

The series FZ … 2RS and FZ … P2RS have 2RS seals.

Application example

Two Internal Freewheels FZ 6206 as indexing freewheels in the drive of the metering roller of a seed spreader. The freewheels are built in an infinitely variable oil bath gearbox. Two cam disks that are set off by 180° are arranged on the gearbox shaft. By means of lever arms, these drive the outer rings of the two adjacent Internal Freewheels, which then gradually turn the metering shaft. The infinite speed settings of the gearbox's drive shaft are executed by means of the respective pivoting of the roller support plate, so that the lever arms can execute lifts of differing amounts.

See page 9 for determination of selection torque.
* The width of freewheel size FZ 6208 is different to the corresponding ball bearing 6208

Mounting

The torque is transmitted on the inner and outer ring by press fit. In order to transmit the torques specified in the table, the outer ring must be accommodated in a housing with an external diameter K. The housing is made of steel or grey cast iron in minimum quality GG-20. When using other housing materials or smaller external diameters, we urge you to contact us regarding the transmissible torque.

The tolerance of the housing bore D must be ISO N6 and the tolerance of the shaft must be ISO n6.

The permissible operating temperature of the freewheel is -40°F to +175°F.

Lubrication

The freewheels are supplied grease-filled for normal operating conditions.

However, the freewheels can also be connected to the customer's oil lubrication system; this is particularly recommended in the case of higher speeds.

Internal Freewheels RC 200

for keyway connection on the outer ring with sprags

30-1

30-2
Application as

▶ Backstop

Features

Internal Freewheels RC 200 are sprag free-wheels without inner ring or bearing support. The customer's hardened and ground shaft is used as the inner ring.

Maximum torques up to 1 240 lb-ft.

The freewheel is incorporated into the custo-mer's housing, allowing for a compact, space saving solution.
Mounting

Internal Freewheels RC 200 require bearing sup-port and a shaft hardened to HRC 58-62 with a 0.060 inch case depth after grinding to a 16 micro finish. Concentric alignment of the shaft and housing bore is required.

Lubrication

Internal Freewheels RC 200 require either grease or oil lubrication. Lubrications containing molybdenum disulphide must not be used.

with sprags

31-1

31-2

Application as

▶ Backstop

Features

Internal Freewheels RC 500 are shaft mounted and are intended to be used with an adjacent bearing to provide proper concentricity and adequate radial support.

Nominal torques up to 1 250 lb-ft.

Mounting

Internal Freewheels RC 500 require bearing support and a shaft hardened to HRC 58-62 with a 0.060 inch case depth after grinding to a 1.6 Rz micro finish. In addition, eccentricity between the shaft and housing bore should not exceed 0.003 inch T.I.R. with a taper on the shaft not to exceed 0.0002 inch per inch of shaft.

Lubrication

Internal Freewheels RC 500 require lubrication and may be either oil or grease lubricated. Lubrication containing extreme pressure additives must not be used.
Backstop	Standard type For universal use	Dimensions						
Freewheel Size	Nominal torque M_N lb-ft	Housing Bore Diameter D inch	Freewheel Diameter D inch	Width inch	Shaft Diameter J inch	Keyway N x P inch	Bearing w/Same OD	Weight lbs

Internal Freewheels RCD

specifically designed as an interchange backstop for shaft mounted reducers with sprags

Size RCD 6

Size RCD 5

32-1

Application as

▶ Backstop

Features

Internal Freewheels RCD are sprag freewheels without bearing support. They are specifically designed as interchange backstops for shaft mounted reducers.

The freewheel is incorporated into the customer's housing, allowing for a compact, space saving solution.

Freewheel size	Freewheel Diameter	Outer Keyway	Width	Shaft Diameter	Inner Ring Bore Diameter	Inner Ring Kw	Weight

Internal Backstops for Shaft Mount Gearbox.
RCD 3 to RCD 5 ride directly on reducer shaft (no inner ring).
Includes Keys.

Mounting

Internal Freewheels RCD are used to interchange backstops installed by the gearbox manufacturer. Installation instructions and recommendations by the gearbox manufacturer should be followed for the safe operation and longevity of the backstop.

Lubrication

Oil lubrication as specified by the gearbox manufacturer should be used. Lubrications containing molybdenum disulphide must not be used.

Questionnaire for selecting RINGSPANN Backstops

RINGSPANN®

Please photocopy or use the PDF-File from our website!

Company:		Date:	
Address:		Inquiry Ref.:	
		Phone:	
Name:		Fax:	
Department:		E-mail:	

1. Where will the Backstop be used?

1.1 Type of machine: _____

In the case of conveyor belts:

Angle of the steepest segment _____°
Multiple-drive? ❏ Yes ❏ No
If yes, number of drives _____

1.2 Backstop location:
❏ on the gearbox
❏ on the motor
❏ elsewhere: _____

1.3 Arrangement:
❏ on a shaft end
 Diameter: _____ inch
 Length: _____ inch
❏ on a through shaft
 Diameter: _____ inch
❏ on a pulley
❏ on a sprocket
❏ elsewhere: _____

1.4 If possible, please include specification, data sheet, sketch or drawing with connection dimensions.

_____
_____
_____
_____
_____
_____

2. Operating data

2.1 Speed at the backstop location (backstop shaft) n_{sp} = _____ rpm

Would it be possible to arrange the backstop on a high speed shaft? (higher speed = lower torque = smaller backstop) If neccesary please give further details on the drawing.

2.2 Nominal power of motor P_0 = _____ hp

2.3 Must the backstop also absorb the peak torque that occurs if the drive motor is started in the locking direction of the backstop (incorrectly poled drive motor)? If yes, the backstop must be substantially oversized.
❏ Yes ❏ No

2.4 Maximum backdriving torque M_{max} = _____ lb-ft

2.5 Lifting capacity of the conveyor system P_L = _____ hp

2.6 Number of daily stops: _____

2.7 Daily operating time: _____ hours

3. Installation conditions

3.1 ❏ Open, outside
 ❏ Open, in a closed room
 ❏ In the machine housing
  ❏ Lubrication by means of oil bath or oil mist in the machine housing
  ❏ Connection to the central lubrication system is possible
 Name of lubricant:
 _____

 Kinematic viscosity:
 _____ cst _____ °F _____ °C

3.2 Should the backstop be releasable?
 ❏ No ❏ Yes, in an emergency
 ❏ Yes, frequently

3.3 Ambient temperature on the backstop:
 from _____ °F to _____ °F

3.4 Other (e.g. accessibility, dust susceptibility and other environmental influences that could be of significance):
 _____
 _____
 _____

3.5 Are there any elastic elements/components located between the backstop and the installation that is to be backstopped (elastic couplings generate considerable peak torques at the moment of stopping)?
 ❏ Yes ❏ No

4. Estimated requirements

_____ Pieces   _____ Pieces/month   _____ Pieces/year

5. Enclosures

❏ Specifications   ❏ Data sheet   ❏ Sketch/drawing

Questionnaire for selecting
RINGSPANN Overrunning Clutches

RINGSPANN®

Please photocopy or use the PDF-File from our website!

Company:	Date:
Address:	Inquiry Ref.:
	Phone:
Name:	Fax:
Department:	E-mail:

1. Where will the Overrunning Clutch be used?

1.1 Type of machine, machine group or installation, in which the overrunning clutch will be used:

1.2 Arrangement of the overrunning clutch (if possible, please include specification, data sheet, sketch or drawing with connection dimensions).

2. Operating data

2.1 In driving operation the drive of the overrunning clutch will be carried out by:

❏ Asynchronous motor
    ❏ direct start-up
    ❏ λ-Δ-start-up
❏ Other electric motor
    Type: _____
❏ Combustion engine
    Type: _____
    Number of cylinders: ___
❏ Turbine
❏ Other (please explain in more detail):

2.2 To be transmitted in driving operation:
Power: _____ hp or
Torque: _____ lb-ft

2.3 Maximum torque _____ lb-ft (Important for drives that develop their maximum torque below their nominal speed.)

2.4 Speed
  1. in driving operation:
    from _____ rpm to _____ rpm
  2. in freewheeling operation:
    (when overrunning clutch is disengaged)
    Primary part (driver)
    from _____ rpm to _____ rpm
    Secondary part (driven machine)
    from _____ rpm to _____ rpm

2.5 Should the overrunning clutch be combined with a shaft coupling?
  ❏ with an elastic coupling
  ❏ with a torsionally stiff coupling
  ❏ _____

2.6 If, upon start up, larger masses are to be accelerated:
Moment of inertia: J = _____ lb-ft^2
Speed of mass: n = _____ rpm

2.7 Torque fluctuations/torsional vibrations during driving operation generate the following torque limits
  ❏ Minimum torque M_{min} = _____ lb-ft
  ❏ Maximum torque M_{max} = _____ lb-ft
  ❏ Min-/Max.-torque is not known

2.8 Daily operating time: _____ hours (hr)
  thereof _____ (hr) driving operation
  _____ (hr) freewheeling operation

3. Installation conditions

3.1 ❏ Open, outside
  ❏ Open, in a closed room
  ❏ in the machine housing
    ❏ Lubrication by means of oil bath or oil mist in the machine housing
    ❏ Connection to the central lubrication system is possible

1. Where will the Indexing Freewheel be used?

1.1 Type of machine, machine group or installation, in which the indexing freewheel will be used:

_____

_____

_____

_____

_____

_____

_____

_____

1.2 Arrangement of the indexing freewheel (if possible, please include specification, data sheet, sketch or drawing with connection dimensions).

_____

_____

_____

2. Operating data

2.1 Index angle of the indexing freewheel:

from _____ ° to _____ °

2.2 Number of actuations (indexes) per minute:

from _____ /min to _____ /min

2.3 The back and forth movement is made by
   - ❏ freewheel outer ring
   - ❏ freewheel inner ring
   - ❏ _____

2.4 The back and forth movement is

generated by
   - ❏ bell crank
   - ❏ hydraulic cylinder
   - ❏ pneumatic cylinder
   - ❏ cam disk or plate
   - ❏ other (please explain in more detail):

_____

_____

_____

2.5 Proposed shaft dimensions:

Diameter _____ inch
Length _____ inch

2.6 Normal torque:
$M = $ _____ lb-ft
Maximum torque:
$M_{max} = $ _____ lb-ft
(including peaks)

2.7 Daily operating time:

_____ hours
